Unbiased credit card data shows consumers true costs

Problem

The general public doesn't have access to unbiased credit card information. The breadth of options and their true costs, like interest rates and fees, are hidden without a hard inquiry to your credit score—making shopping impossible without negatively impacting your credit. While many sites offer card comparisons and recommendations, they typically operate as “pay-to-play” in which featured cards are actually paid advertising. Smaller banks and credit unions often aren't seen, even though they offer some of the lowest-cost, most consumer-friendly options on the market.

Solution

Help consumers explore lower-cost options by taking existing credit card data collected by the Consumer Financial Protection Bureau and adapting it for a consumer audience. Using a co-design approach with end-users, the tool allows consumers to quickly see the wide range of credit card options available and easily access hard to find costs.

Co-design from the outset improves outcomes

The CFPB already collected and published credit card data publicly, but the insights, like smaller institutions offering rates far lower than the top 25 companies, weren't reaching consumers. Our goal was to make the data and insights accessible to average consumers. The best way to achieve that was to hear directly from them.

We used an iterative, equity-centered design process to conceptualize the tool and bring it to life. Participants in early interviews were asked to brainstorm with us and then invited back to provide feedback and test each iteration.

My contributions

- Product management including facilitating kick-off, project planning, roadmapping, and product brainstorming
- Coordination and management of stakeholders, including from Director's Front Office
- Ensured research and design followed a co-design process

Meeting users where they are builds trust and creates educational opportunities

Consumers wanted results to reflect their needs as closely as possible. During testing, if they couldn't find the credit card features important to them, they said they'd return to sites they used in the past. To gain adoption, we wanted to use patterns and card types that users were already familiar with.

Initially, senior leadership feared this approach could potentially highlight harmful card types and the team was asked to remove them—the very card types most consumers cited as wanting.

Instead, we successfully pitched the strategy of meeting users where they are. Using research data, we designed for the types of cards consumers expected, but included warnings and alternatives to the problematic cards. This built an educational opportunity instead of abandonment.

My contributions

- Led product brainstorms, concept sketching, and prototyping
- Performed competitor audit
- Translated research findings into design recommendations
- Ensured design met WCAG AA accessibility standards or higher
- Created illustrations to CFPB design standards

Rating system demystifies interest rates

Over and over consumers told us that they had trouble understanding what interest rates really meant. What was a “good” interest rate? How did these rates compare to each other? They wanted guidance and recommendations. In response, we designed a rating system using color and icons to help consumers easily decode and compare—based on their best interests instead of which company was able to pay.

My contributions

- Facilitated filtering and rating system criteria discussions between stakeholders, data scientists, and developers
- Created flowcharts to document filter criteria decisions

Use the ratings to compare your results:

- 💰 Pay less interest (9.9%-19.49%)
- 💰💰 Pay average interest (19.5%-29.95%)
- 💰💰💰 Pay more interest (29.99%-35.99%)

“Insider tips” kept content brief and relevant

The consumers we interviewed appreciated quick tips embedded in the tool. As one consumer put it, “it’s like insider info” in a market that can feel difficult to decipher. As a result, the tool’s results page includes “Did you know” information boxes tailored to the consumer’s chosen situations. Instead of placing this information at the top of the page, which during our research consumers found to be overwhelming, we instead wove them into the results as something they could review in context with the results they were seeing.

My contributions

- Created a release plan that focused on what we wanted to learn from user testing at each phase
- Designed each new iteration on the previous release’s user testing, creating a feedback loop of data-driven improvements

Empowered consumers with readable “fine print”

Credit card agreements are notoriously difficult to read and understand. We wanted to provide consumers with important card features broken down in an easy to read format.

 Purchase interest rate and fees

9.99%*

Purchase APR

*As of Jun. 30, 2024. Advertised purchase APRs change over time. Check rates before applying.

Here are typical APRs for different credit scores for this card:

Credit score	Median purchase APR	Comparison to other cards
619 or less	9.99%	 Pay less interest
620-719	9.99%	 Pay less interest
720+	9.99%	 Pay less interest

After opening the credit card, the purchase APR is fixed, meaning it will not go up or down with changes to an index, but it may still change. Learn more about [APRs in general](#) and about [fixed versus variable APRs](#).

Used consumer expectations to drive momentum

The Bureau collects credit card data from companies on a 6 month cadence, which when comparing interest rates, can lead to variance in rates reported during the collection period and what is currently available on the market.

While this was a concern for our team and leadership, the hope was that with time the cadence of our collection would increase and so would our data quality. That all changed once leadership actually saw stale data in the tool itself. The product launch was paused and it was unclear whether the project would move forward at all.

We assumed the data lag would be a big problem for consumers, but we hadn't actually asked them what they were expecting. We decided to test a version that included disclaimers and the need to check with companies for the most current rates. To our surprise, most people seemed unconcerned and even expected to need to contact the company. With this knowledge we were able to recommend an iteration leadership was excited to launch.

My contributions

- Led team through a major setback
- Facilitated team next steps and brainstorming
- Designed and presented data-based recommendations to senior leadership that led to successful launch

Success based on a product's entire lifecycle

Our work doesn't end on launch day. At a small government agency, our maintenance burden can eat into our ability to build new or improve existing products. When designing and developing we consider the entire lifecycle of a product including how it's performing against our objectives as well as what it will take to update and maintain it. This improves outcomes for consumers and our team alike.

For Explore Credit Cards, that meant defining success indicators for consumers, card issuers, and the credit card market. At a high-level we defined the positive impacts the tool would have if it was working well, like consumers finding lower-interest cards and saving money or card-issuers competing to be shown in our top results—lowering interest rates across the market. We also outlined potential negative impacts if the tool wasn't performing as expected. We then broke those down into metrics we could monitor and evaluate.

My contributions

- Product decision-making intentionally focused on lowest lift and long-term maintenance costs
- Defaulted to using established and tested Design System patterns and components, customizing only when they proved unsuccessful
- Led development of a success metrics and maintenance plan to monitor and evaluate the tool's performance

Combining complaint forms to improve the financial marketplace

Problem

Submitting a complaint with the Consumer Financial Protection Bureau gives consumers the opportunity to get help with their own issues, while providing the CFPB real time insight into problems. This helps to identify and stop inappropriate practices, and as a result, creates a better financial marketplace for everyone. One main issue was the use of individual forms for each financial product or service, already 11 and growing, making each increasingly difficult to manage and upgrade.

Solution

All individual product forms were combined into one dynamically driven form, improving usability and completion rates. Maintenance burdens and timelines were cut by allowing updates to be applied to all product types simultaneously. The redesign also brought the form's style in line with CFPB's brand and content standards, and followed industry best practices, like responsiveness.

Slowing users down provided less confusing start

Research showed that users often started the form without reading any other information, creating confusion over the role of the CFPB and the process itself. In an effort to clearly set expectations we took a number of steps. First, we removed the button from the hero space at the top of the page, encouraging users to read introductory content, second, we added illustrations and more engaging content describing how submitting a complaint can help them and others, and third, we added a “Before you get started” page to the beginning of the form to reiterate any information they may have missed.

My contributions

- Led redesign brainstorms, concept sketching, and prototyping
- Assisted with usability and accessibility testing
- Translated research findings into design recommendations
- Created illustrations to CFPB design standards

BEFORE

What type of problem are you having?

Most of the **conventional home mortgage** complaints we get are about one of the following topics. Select the one that best describes your complaint. You will have the chance to explain your complaint in detail in the next step.

☐ Applying for a mortgage or refinancing an existing mortgage
(application, credit decision, underwriting)

☐ Struggling to pay mortgage
(loan modification, behind on payments, foreclosure)

☐ Closing on a mortgage
(closing process, confusing or missing disclosures, cost)

☐ Problem with credit report or credit score

☐ Trouble during payment process
(loan servicing, payment processing, escrow accounts)

About us

The CFPB is a federal agency built to help you write and enforce your rights and other financial goals fairly. We also help consumers, help informed choices.

HAVE A QUESTION

(855) 411-2375

LOG INTO YOUR ACCOUNT

Want to check your status or you already submitted a complaint?

Ask questions as questions, get better responses

In previous versions of the form, questions weren't actually asked as questions, but instead as a single word prompt. In an effort to make the form easier to understand and complete accurately, we updated prompts throughout the form to directly ask a question, and often included examples or helper text to clearly describe the information that was being requested. For example, we're now asking "What type of problem are you having?" instead of "Issue."

Improved experience and outcomes with dynamic pages

With this redesign we were able to start using dynamically driven questions and skip-logic, which enabled the ability to ask more specific questions based on a user's response and to hide questions that weren't relevant.

Based on user testing, we found that a large majority of users wanting to submit a credit reporting issue chose the product that caused the issue, for instance, their mortgage, instead of classifying it as a credit reporting issue, leading them to send their complaint to the wrong company.

By employing dynamic pages we were able to help users file their complaint as intended by adding 'Problem with credit report or score' in step 2 and altering the flow of the form to include questions as if they had selected it in step 1. This allows users the ability to send the complaint to one or both companies and improves their chances of having their issue resolved.

My contributions

- Reduced form complexity, added clearer guidance, and improved usability which increased the number of successfully submitted complaints—aiding the CFPB in returning more than \$21 billion to consumers

An official website of the United States Government

(debt was paid, discharged in bankruptcy, result of identity theft, was owed by a deceased family member)
- ☐ Written notification about debt
(didn't receive, didn't know you could dispute debt)

A “normal” shift helps consumers avoid leaving money on the table

Problem

The age Americans claim Social Security affects their lifetime income. Many claim their benefits before their full retirement age, meaning they take lower benefits for the rest of their lives in exchange for getting a Social Security check sooner. While not possible for all Americans, it’s objectively a positive choice to claim benefits later, to increase benefits and create a larger safety net later in life.

Solution

The Consumer Financial Protection Bureau built a tool that highlights a user’s full retirement age, illustrates the impacts of claiming benefits earlier or later, and asks lifestyle questions to help inform and dispel common retirement misconceptions, in order to help consumers think through this complex decision.

Sketches visualize the plan

Research shows that the more accurately someone is able to visualize a future plan, the more capable they are in preparing for it. For this reason, preliminary sketches included concepts that aimed to help users visualize how various sources of income stacked up to meet their projected needs. The intent was also to highlight possible gaps and provide tips to fill those gaps, including part time work or claiming benefits later.

My contributions

- Led design brainstorm, concept sketching, and prototyping
- Translated research findings into design recommendations

Fewer inputs, higher engagement

After researching similar tools, many of which required users to fill out large amounts of data, like their income for the past 30 years, we knew we wanted to provide a less overwhelming experience.

Considering our main objective was to help people understand how claiming age affects their benefit, not to provide an exact amount, we were able to pare down the required data to only two inputs, birthdate and highest annual income, making it a lot easier for users to get started.

My contributions

- Performed competitor audit
- Created illustrations to CFPB design standards

Step 1: Explore how your claiming age affects your Social Security retirement benefits

Enter your information below to see your estimated benefits.

Date of birth
8 20 1960

Highest annual work income ⓘ
\$60,000

[Get your estimates](#)

We base your benefit estimate on current formulas from the Social Security Administration. Your answers are anonymous. Because we do not access or use your Social Security earnings record, these are rough estimates.

Your estimated benefits:

Select claiming ages on the graph to see how your estimated benefit changes.

Age 67 is your full benefit claiming age.

View estimated benefits as: ☒ monthly income ☐ annual income

By age 85, an average lifespan, your total benefits will be **\$388,584** (in today's dollars)

About your full benefit claiming age:

- It is based on the year you were born.
- At this age, you will receive your full benefit with no reductions.

Remember, claiming age here refers only to your Social Security retirement benefit, and not when you decide to stop working or apply for Medicare.

[Where do these numbers come from?](#)

Step 1: Explore how your claiming age affects your Social Security retirement benefits

Enter your information below to see your estimated benefits.

Date of birth
8 20 1960

Highest annual work income ⓘ
\$60,000

[Get your estimates](#)

We base your benefit estimate on current formulas from the Social Security Administration. Your answers are anonymous. Because we do not access or use your Social Security earnings record, these are rough estimates.

Your estimated benefits:

Select claiming ages on the graph to see how your estimated benefit changes.

Claiming at age 65 **reduces** your monthly benefit by 13%
Compared to claiming at your full benefit claiming age.

View estimated benefits as: ☒ monthly income ☐ annual income

By age 85, an average lifespan, your total benefits will be **\$374,160** (in today's dollars)

About your early benefit claiming age:

- Earliest age you can claim your benefit is 62.
- If you claim your benefit before your full claiming age, it will be reduced.

Remember, claiming age here refers only to your Social Security retirement benefit, and not when you decide to stop working or apply for Medicare.

[Where do these numbers come from?](#)

Sliding graph shifts perceptions of “normal”

Research shows that most people cite an age from 62-65 as their “normal” or full retirement age, when it’s usually later than that. The graph was designed to change that perception by showing the user’s full benefit as default. This was reinforced by colored bars and the percentage of increase or decrease of each claiming year.

My contributions

- Concept and design of interactive graph and components
- Assisted with usability and accessibility testing

Personalized content increases engagement

During testing, users gravitated towards concepts that included lifestyle aspects and to content they felt applied to their unique situation. For this reason, the team included interactive lifestyle questions that provided different content based on a user's response, increasing engagement and providing more relevant information. Additionally, the layout allowed users to pick and choose items of interest, reading what is important to them, versus showing an overwhelming body of content that would likely go unread.

My contributions

- “Gamified” design to increase engagement with content
- Plain language writing and testing
- Designed consistent and user-centered experience across breakpoints and devices
- Ensured design met WCAG AA accessibility standards or higher

Step 2: Learn tips specific to your situation

Picture your life in retirement to receive claiming tips.

Are you married?

Do you plan to continue working in your 60s?

Will your expenses decrease after you retire?

Many people find retirement is more expensive than expected.

Future expenses are difficult to predict. Some regular expenses like out-of-pocket health care costs will likely increase as you get older. You can protect your retirement lifestyle by reducing your largest expenses. Consider downsizing or paying off your mortgage before you retire. You can also increase your regular income by claiming at your full Social Security benefit age or later. If you claim earlier, your monthly benefit could be reduced by as much as 30 percent.

Do you expect to have additional sources of retirement income beyond Social Security?

Do you expect to live a long life?

Step 3: Learn your next steps

Select the age you plan to claim your Social Security retirement benefits.

(This will not affect your Social Security account or begin an application.)

You've chosen age 68, which is later than your Social Security full retirement claiming age.

This means you will get an increase in your monthly benefits! Here are steps to help you in the next few years.

- 1 Create a [my Social Security account](#) to review your expected benefits based on your actual Social Security record. You will also find additional information about your eligibility and other benefits including disability and survivor benefits.
- 2 While you let your benefits continue to grow, you can keep working if you want. You can also stop working and use a portion of your savings to cover your needs. [Learn the rules about withdrawing money](#) from your retirement accounts.
- 3 If your income, employment, or marital status changes, you may need to reconsider your claiming age. Visit us again!

Making a commitment improves preparation

Hopefully armed with a better understanding of claiming Social Security benefits, the tool's last step asks users the year they intend to claim. Research shows that committing to a claiming age actually impacts behavior, in that people are more likely to think about and prepare for their life in retirement after doing so. This question also provided an opportunity to give users next steps specific to their age and intended claiming year.

My contributions

- Collaborated with Behavioral Scientists to ensure design reinforced positive changes and avoided negative consequences

Accurate and comparative student loan data clears a path to informed decisions

Problem

For-profit college chain Bridgepoint Education, Inc. deceived students into taking out private student loans without knowing the true cost and were therefore obligated to make payments greater than what they were promised.

Solution

In addition to ordering Bridgepoint to discharge all outstanding private loans and to refund loan payments already made, the Consumer Financial Protection Bureau built a loan disclosure tool that all potential students entering Bridgepoint must use. It clearly and accurately helps students review their personalized financial aid offer and provides information about graduation, loan default rates, potential salaries, and post-graduation budgeting that helps students make informed decisions about their financial futures.

Interviews focus on future

The first step in the process of creating the tool was to conduct research interviews with former students of for-profit colleges. We repeatedly heard that if they only knew what they were getting into, they would never have taken out the loan. With this in mind, we started sketching, often coming back to the question, what would their future self want to know?

My contributions

- Assisted with research interviews
- Translated research findings into design recommendations
- Led design brainstorm, concept sketching, and prototyping

“I wish someone told me what it meant for 30 year old me to take out that money.”

“At the beginning, I realized there were red flags, but I didn’t pay attention to them.”

“Made tons of promises that didn’t come true.”

“I wish I’d known up front that financial aid wasn’t going to cover everything.”

How much can you contribute without going into debt?

This section includes loans that your family has to repay, but those loans are not included in *your* personal debt or student loan payments summary.

PERSONAL AND FAMILY/OTHERS CONTRIBUTIONS

Cash you will pay
Includes money that you can pay now or will earn during the school year

Money your family or others will pay
Includes money given to you from family or others, private loans your parents take out, etc.

Parent PLUS loan
Federal loans your parents take out and repay; does not count toward your total student loan debt shown in this tool

Federal Work-Study
Money you earn per year from an eligible Federal Work-Study job while in school; awarded based on financial need

What does this mean for your future?

Think about how borrowing \$7,500 this year will affect your future finances. As you can see in the summary, the total cost of these loans after two years plus interest and fees equals \$20,915.

Some students find themselves struggling to repay student debt once they leave school. In Step 2, learn how factors like graduation rates and expected salary can affect your ability to repay your student debt.

Big picture

Your out-of-pocket cost	\$	12,316
Your contributions	(-) \$	4,816
Your debt	(-) \$	7,500
Remaining cost	\$	0

Debt summary

Loans for first year	\$	7,500
Loans for two years (program length)	\$	15,000
Total cost of repayment with interest and fees	\$	20,915

Big picture can lead to big savings

In an effort to highlight the future financial impact of their offer we included a “big picture” take-away that changed based on edits made to the costs of the program or how students planned to pay for it. They are able to see how even a small amount saved each year could end up as a big savings later on, or the opposite.

Real school stats for informed decisions

Often students attending Bridgeport were told inflated projected salaries and graduation rates, making them believe that even though tuition might be expensive, it was worth it in the end.

The second step of the tool shows applicants actual graduation rates, average salaries, and loan default rates based on students who attended their programs. This allowed prospective students the opportunity to make informed decisions based on fact rather than fiction.

My contributions

- Assisted with usability and accessibility testing
- Ensured design met WCAG AA accessibility standards or higher
- Designed consistent and user-centered experience across breakpoints and devices

Step 2: Weigh the financial impact of your offer

The information in this section will help you understand how accepting this offer could affect your ability to pay back your student debt and impact your financial future.

How many students graduate?

Remember, whether you get your diploma or not, you'll still have to repay federal and private loans (and possibly even some grants). If you don't graduate, you won't have the added benefit of your degree to help earn more money to put toward paying off student loans.

Graduation rate

Percentage of first-time, full-time students who graduate from this school

This school — 21%

Curious about the graduation rate for the entire school? [See how this school's graduation rate compares to the national average](#)

How do I know if I'm about to take on too much debt?

The typical salary for students who started attending this school 10 years ago is \$39,100 per year. In reality, you could end up making more or less than the salary shown here.

If your total debt is too high, it increases the chances of

Your salary and total student debt

A general rule of thumb is that you should avoid borrowing more for school than you'll

Informed students equal positive results

The final piece of the tool provides students with next steps and strategies to help them lower expected debt, like working while studying or considering alternative programs with better outcomes.

Students are also given the opportunity to leave feedback on whether the tool was helpful to them. The tool received feedback from well over 5,000 students, nearly all overwhelming positive, illustrating the effectiveness of the tool.

“Yes, this was very helpful! Gives a realistic picture of the cost of education and how it will impact my finances.”

“Very helpful in providing a real, tangible look at debt and how to address it going forward. Very good tool!”

“I think this made things very clear and it is something I wish I’d had access to when I went to another school. Thank you.”

The value of data-driven planning is made visible

Problem

The Nigerian Government needed a way to collect and analyze data used to inform policy and planning for poverty reduction and ultimately achieve the Millennium Development Goals. After on-the-ground data collection, the majority of end users were unable to effectively parse the raw data.

Solution

The Nigeria MDG Information System was built to provide the critical last step—visualization. It turned complicated data into digestible content, allowing users to quickly access essential information.

Accessible homepage helps new users navigate

One of the exciting challenges with this redesign was that the data was going to be public, a first for the country. We knew we needed to make the homepage more accessible by explaining the system itself and the type of data that could be found, making it easier for new users to navigate.

My contributions

- Led design including concept sketching and prototyping
- Project and stakeholder management

BEFORE

BEFORE

Data type options

View options

Distinct interactions for improved experience

Previously, there was no visual distinction between buttons that allowed users to choose the data type, like “health” or “education” with how they wanted to view it, creating confusion. We redesigned these actions to be distinct in placement and style as well as adjusting the labels to be more plain language, making the experience more intuitive.

BEFORE

Detailed visualizations provide bigger picture

With this release, users could view data spatially, like which classrooms had chalkboards, or which clinics had refrigerators for vaccine storage. This made it easier for planners to get a larger picture of the resources available (and needed) at each location and the distances people would need to travel to reach them.

THANKS FOR TAKING THE TIME TO REVIEW MY WORK, TO LEARN MORE:
